

Financing Resilience and WEFE Nexus Professional Series - Tools Pack

● Lecture 1: Identification & Classification

Objective: Establishing the "Nexus Logic" to attract premium climate financing.

- **Theory of Change (ToC):** Used to map systemic feedback loops (e.g., how water efficiency leads to energy savings).
 - **Guide:** [UNDP Theory of Change Guidelines](#)
- **WEFE Nexus Screening Matrix:** A tool to check if a project is truly "integrated" or just "coordinated."
 - **Guide:** [FAO WEF Nexus Rapid Appraisal Manual](#)
- **Real-World Case: The Noor Ouarzazate Solar Complex (Morocco).** This CSP plant used dry-cooling to protect scarce water resources for local agriculture.
 - **Reference:** [World Bank Project Portal: Noor Ouarzazate](#)

● Lecture 2: Integrating WEFE into Existing Projects

Objective: Identifying "entry points" for optimization to reduce OPEX.

- **Problem & Objectives Tree:** Finding the root causes of resource waste (e.g., high energy bills due to water leaks).
 - **Guide:** [EuropeAid Project Cycle Management Guidelines](#)
- **Multi-Criteria Decision Analysis (MCDA):** Prioritizing which retrofit (e.g., biogas vs. solar pumps) has the best ROI.
 - **Guide:** [OECD Multi-Criteria Analysis in Infrastructure Governance](#)
- **Real-World Case: Johannesburg Wastewater-to-Energy.** Retrofitting plants with anaerobic digesters to produce biogas (Energy) from sludge (Waste).
 - **Reference:** [WRC South Africa: Energy from Wastewater Report](#)

● Lecture 3: Financing Instruments & Capital Stack

Objective: Layering different types of capital to make the project "Bankable."

- **Logical Framework (LogFrame):** The technical "contract" between the project and the funder.
 - **Guide:** [World Bank LogFrame Handbook](#)
- **Incremental Cost Analysis:** Proving why the "Nexus" solution is better than the "Baseline" (Mandatory for GCF).

-  **Guide:** [GEF Policy on Incremental Costs](#)
- **Real-World Case: Kenya Tea Development Agency (KTDA) Small Hydros.** A "Capital Stack" of equity from farmers, concessional loans from AFD, and grants for feasibility.
 -  **Reference:** [Proparco: KTDA Small Hydro Project Summary](#)

● Lecture 4: Financing Risks During Operations

Objective: Ensuring the project remains solvent during droughts or market shifts.

- **Climate Risk & Vulnerability Assessment (CRVA):** Stress-testing the project against 2050 climate scenarios.
 -  **Guide:** [World Bank Climate & Disaster Risk Screening Tools](#)
- **Financial Stress Test (DSCR/NPV):** Calculating if the project can pay its debt if electricity costs rise or crop yields drop.
 -  **Guide:** [World Bank Infrastructure Finance & PPP Toolkit](#)
- **Real-World Case: Floating Solar on Hydropower Reservoirs.** Solar protects water from evaporating while producing power when water is low.
 -  **Reference:** [World Bank: Floating Solar Panels - New Renewable Frontier](#)

● Lecture 5: Navigating WEF Nexus Funding Calls

Objective: Identifying and winning international donor opportunities.

- **SDG Alignment Matrix:** Mapping contribution to SDGs 2 (Food), 6 (Water), 7 (Energy), and 13 (Climate).
 -  **Guide:** [UNDP SDG Impact Standards](#)
- **National Policy Alignment (NDC/NAP):** Proving the project fits the country's climate commitment.
 -  **Guide:** [NDC Partnership Knowledge Portal](#)
- **Real-World Case: WE4F (Water and Energy for Food) Grand Challenge.** A global call for innovations that increase food production with less water and energy.
 -  **Reference:** [WE4F Innovation Hubs - Official Site](#)

Final Training Reference Table

Lecture	Core Tool	Verified Authority Link
1. Identification	Theory of Change	UNDP

Lecture	Core Tool	Verified Authority Link
2. Optimization	Problem Tree / MCDA	OECD
3. Bankability	LogFrame / Incremental Cost	World Bank
4. Risk	CRVA / Stress Testing	World Bank Tools
5. Funding	SDG & NDC Matrix	NDC Partnership
